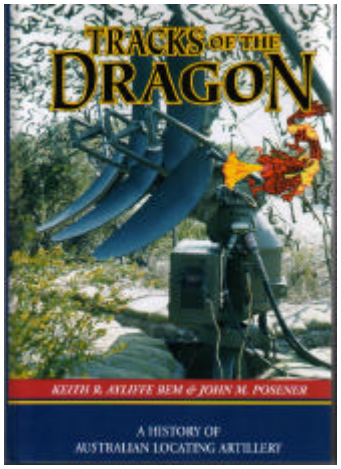
Book Order Form

Tracks of the Dragon
a history of Australian Locating Artillery

by Keith Ayliffe. BEM and John Posener



From World War One and its massive artillery duels the need for a locating system came into its own. The aim was to track the trajectory of the incoming artillery shells and mortar bombs and locate the enemy firing position.

The systems were refined through World War Two and by Vietnam, Radar was playing a major role in the detection of firing positions.

A fascinating aspect of artillery and one of those behind the scenes aspects of war that most of us no little about…….
